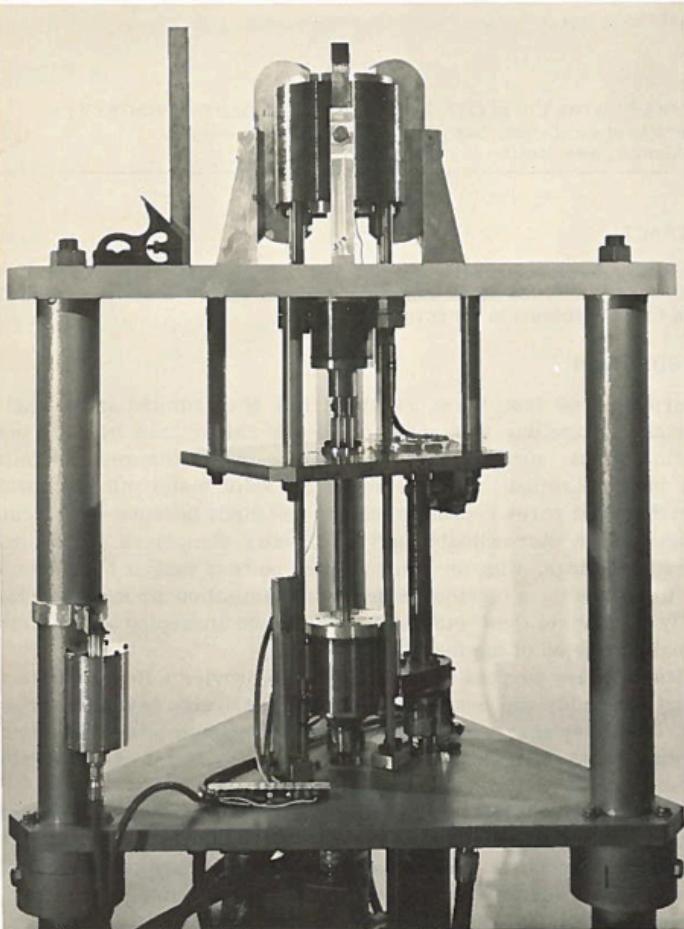

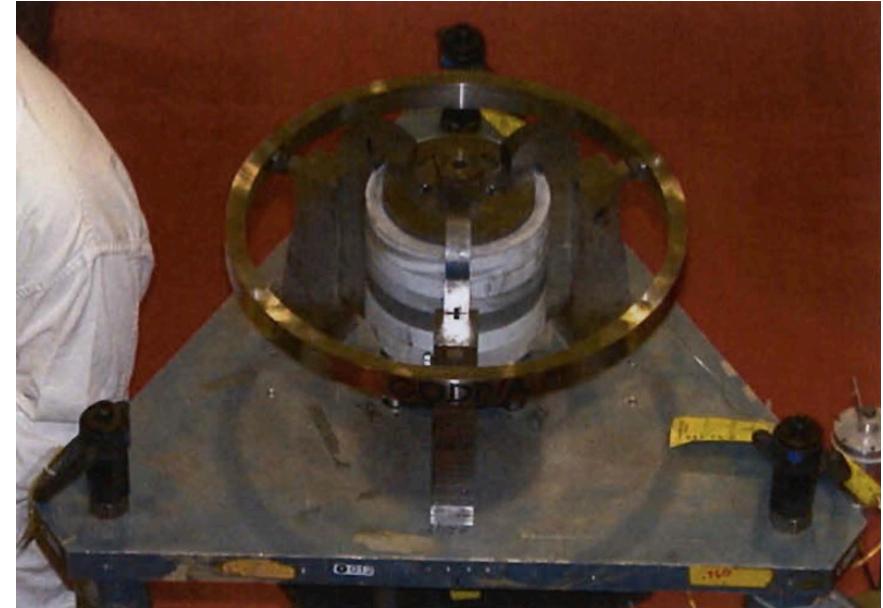

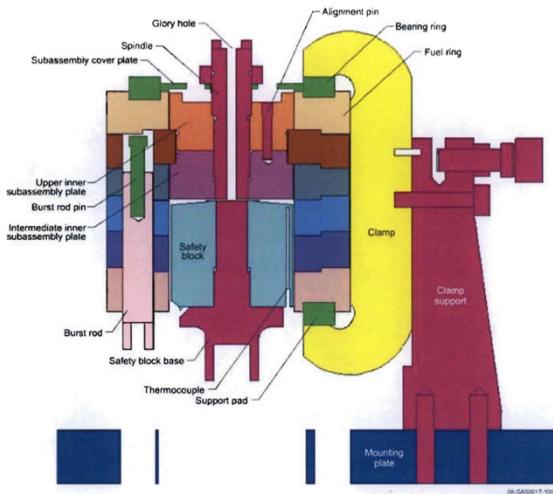

Fig. 1—First version of Godiva IV on three-legged support stand showing stationary ring assembly above the top shelf with safety block visible just below and the electromagnetic latching assembly above the bottom shelf.

*Top view of the Godiva-IV core and its restraints. (from LA-UR-09-01007)*

# Experimental Setup

*Schematic of the Godiva IV core*

Prompt Radiation  
Detector

4 Sensor  
Scintillator  
Photomultiplier  
/Photodiode

Cable  
~100 ft

Recorders

Control Room

1.5 or 3 m from Godiva

## Prompt Detector Measurement Summary

Date	Godiva Burst #	Reactivity (Cents)	Delta T (°C)	LLNL Prompt Data
4/15/2014	1977	102.0	75.4	
4/15/2014	1978	106.0	129.7	Y
4/16/2014	1979	111.0	236.9	Y
4/17/2014	1980	110.5	232.4	recorded preburst
5/27/2014	1990	111.3	229.9	Y
5/28/2014	1991	106.9	136.9	Y
5/28/2014	1992	102.0	69.2	
5/28/2014	1993	-	71.1	
5/29/2014	1994	102.0	68.5	

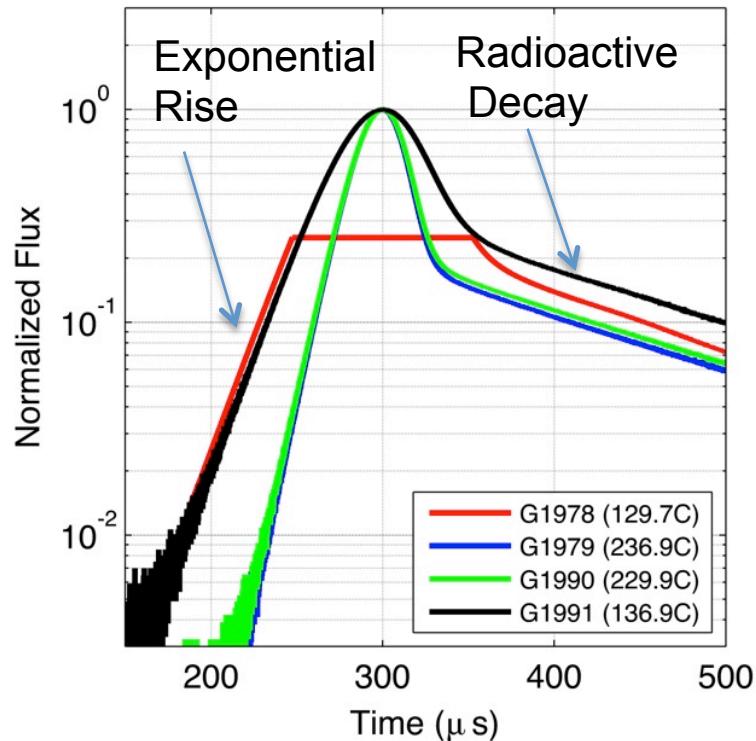

**Prompt Detector Data Recorded on 4 Godiva Bursts**

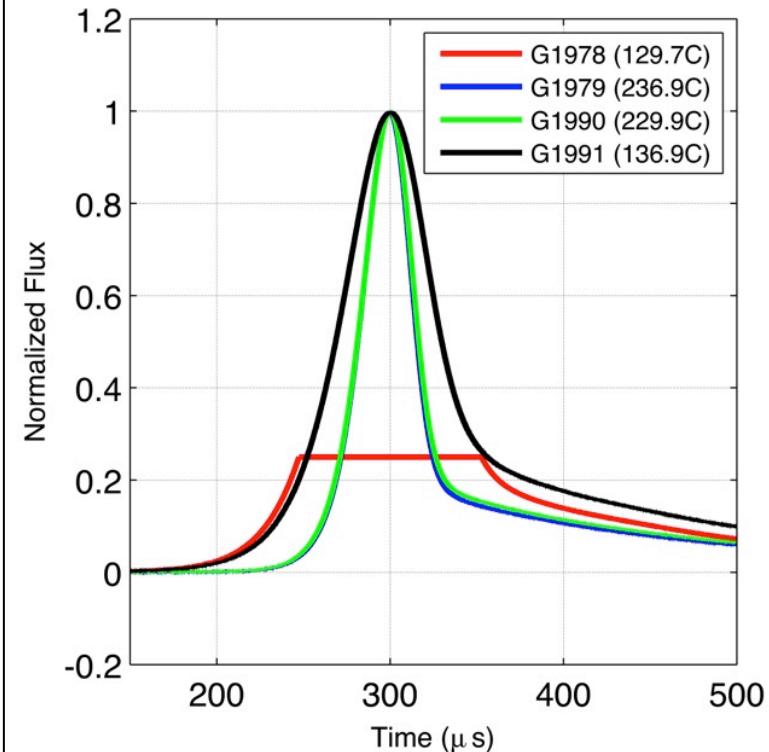

Lawrence Livermore  
National Laboratory

## Comparison of Prompt Peak Signals from Godiva Bursts.

**Photo Diode Signal Log Scale**

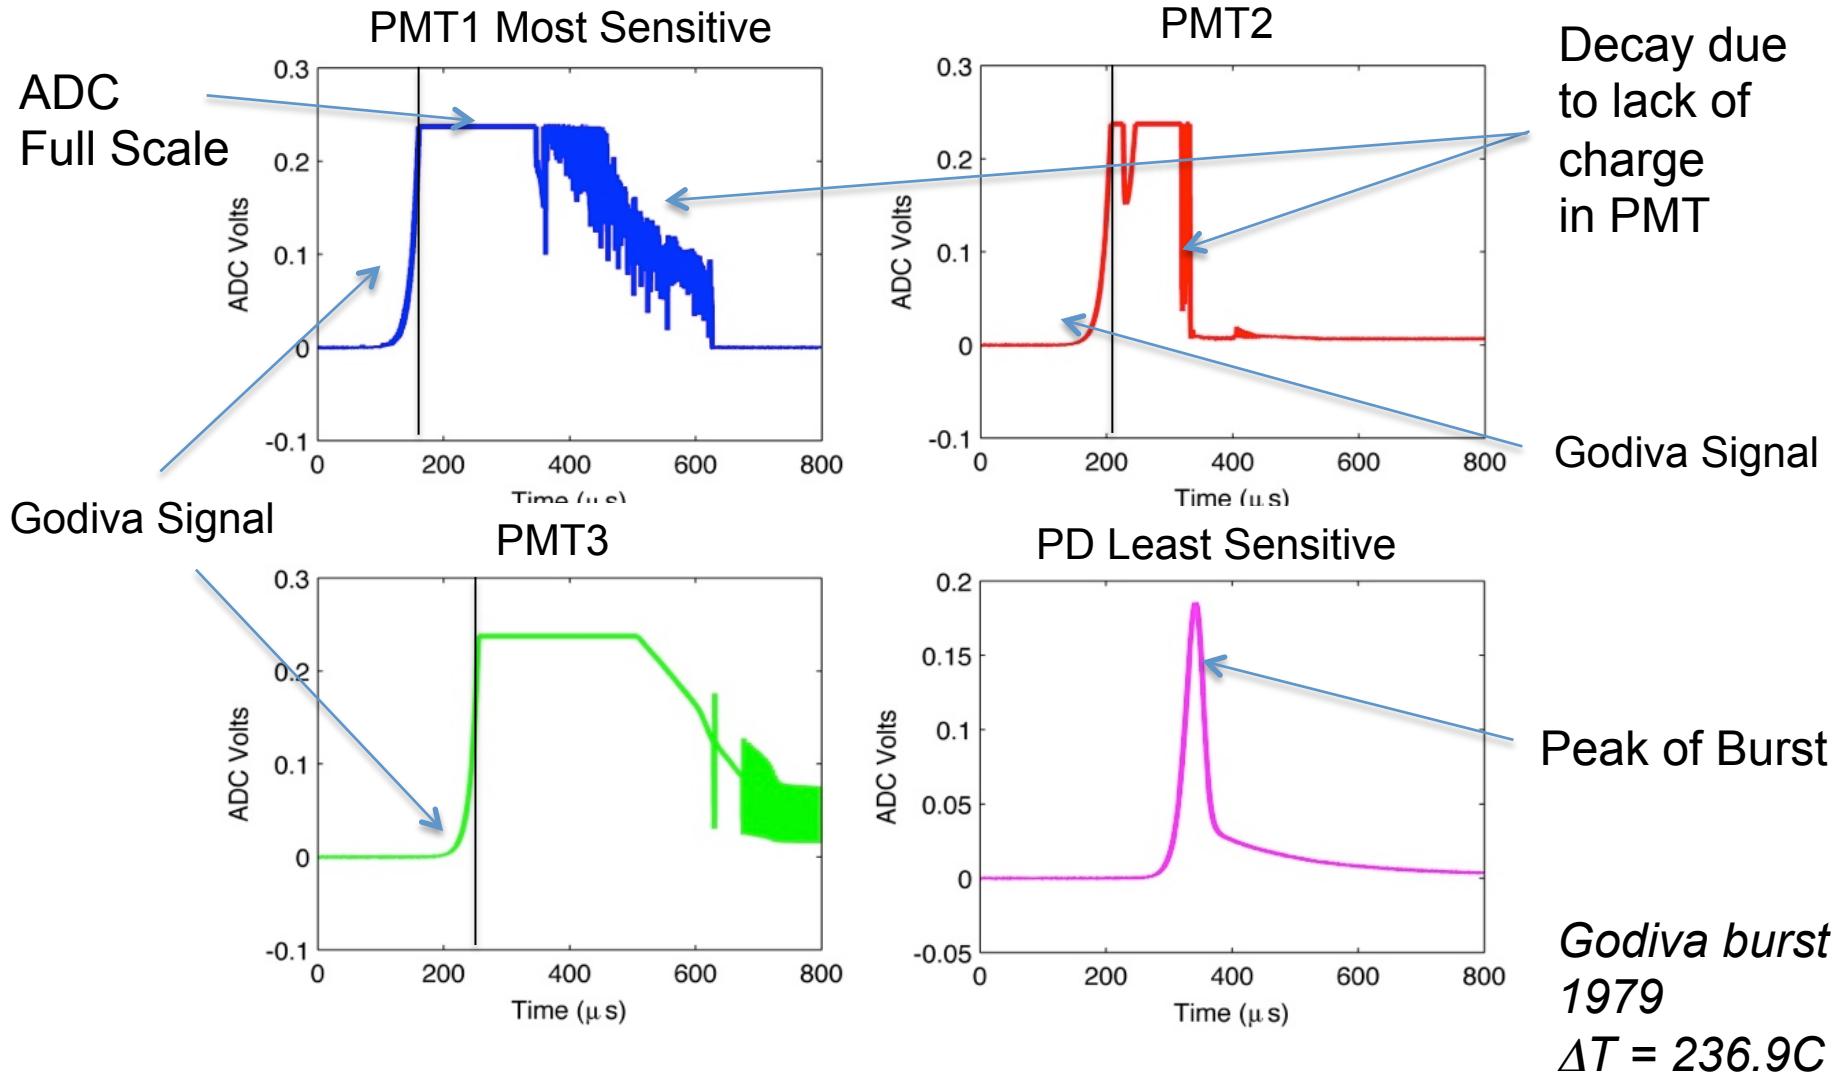

**Photo Diode Signal Linear Scale**

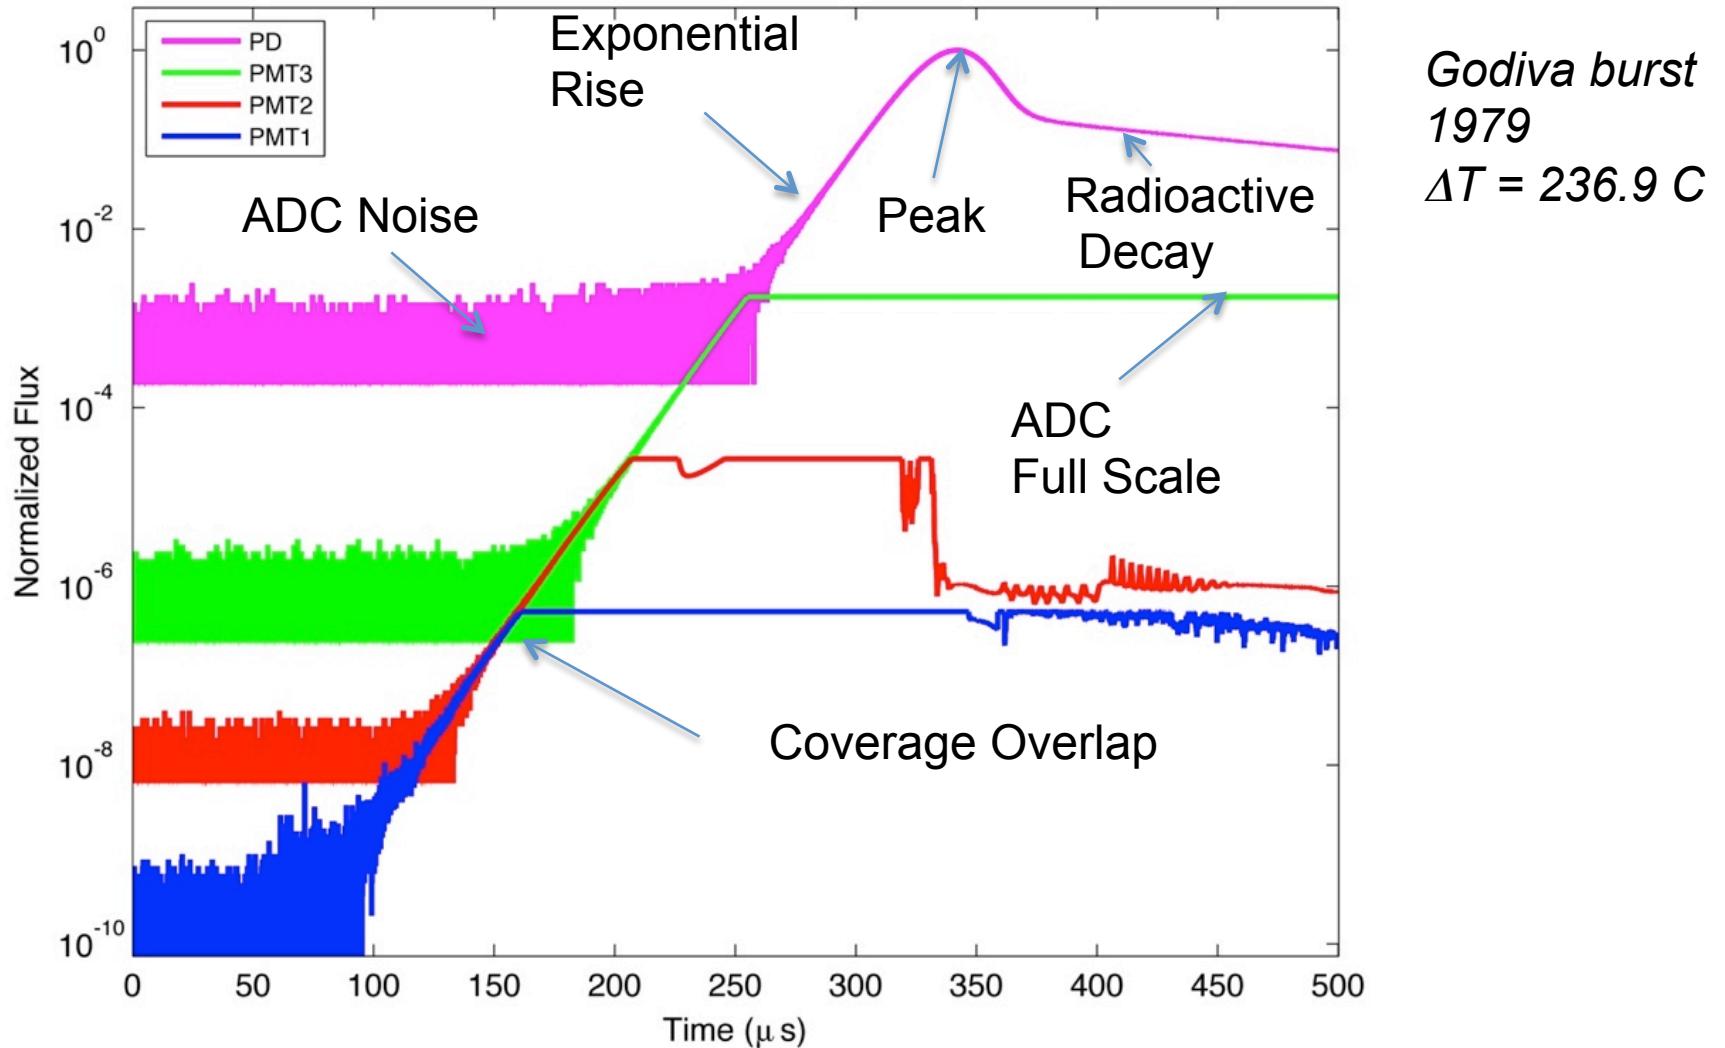

**Godiva Bursts are very repeatable**

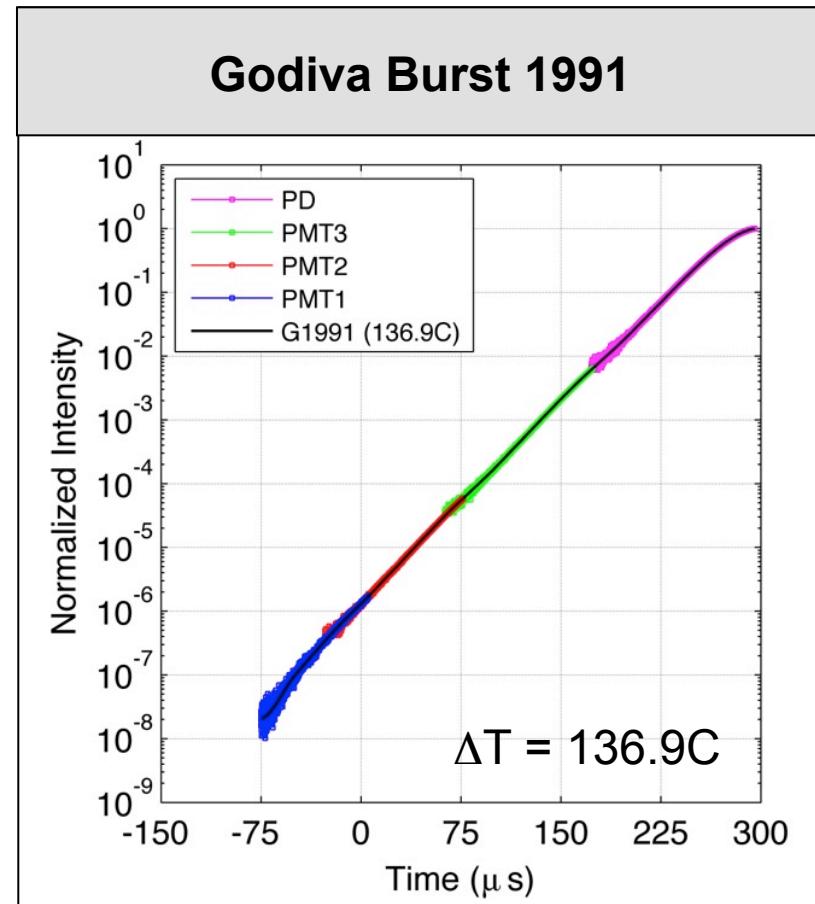

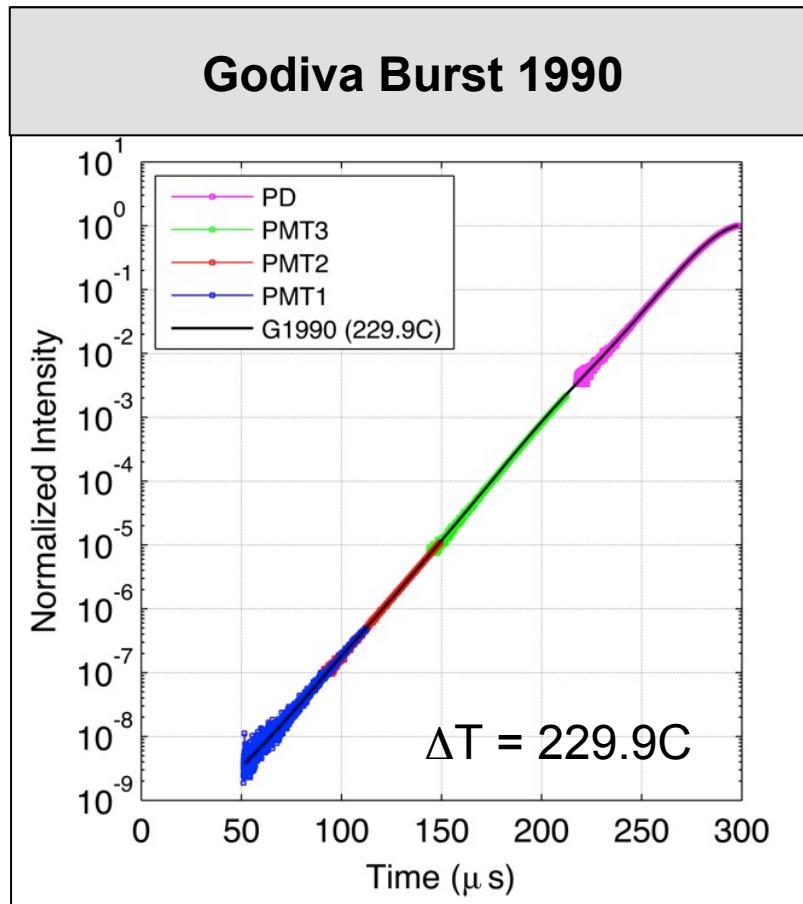

## Raw Prompt Detector Data from a Godiva Burst

## Sample Prompt Detector Data from a Godiva Burst

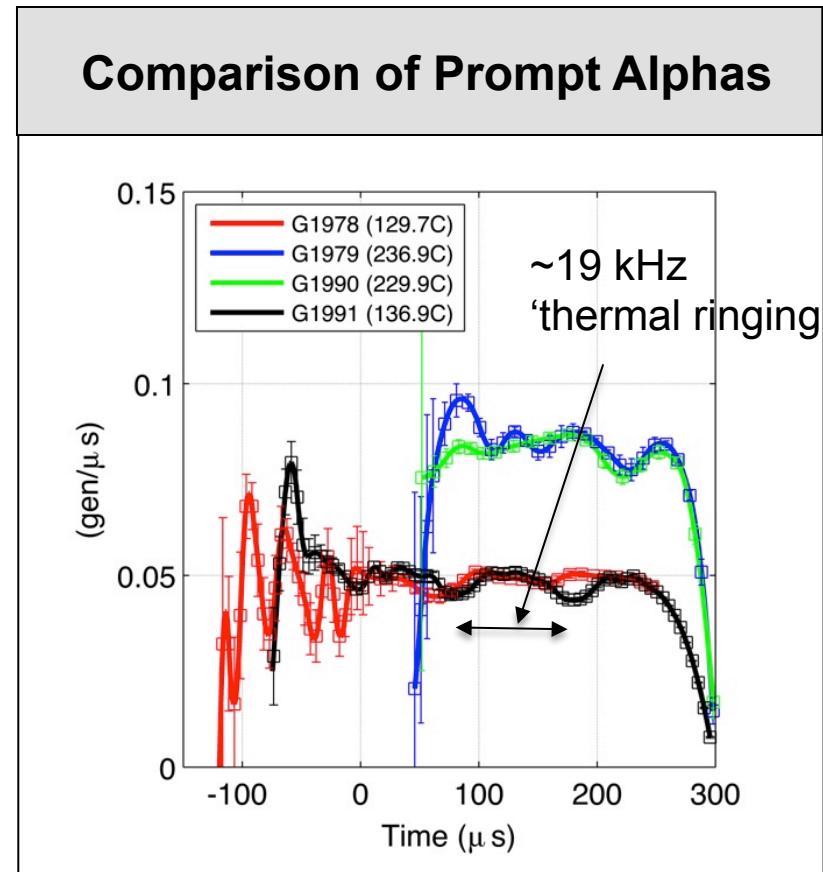

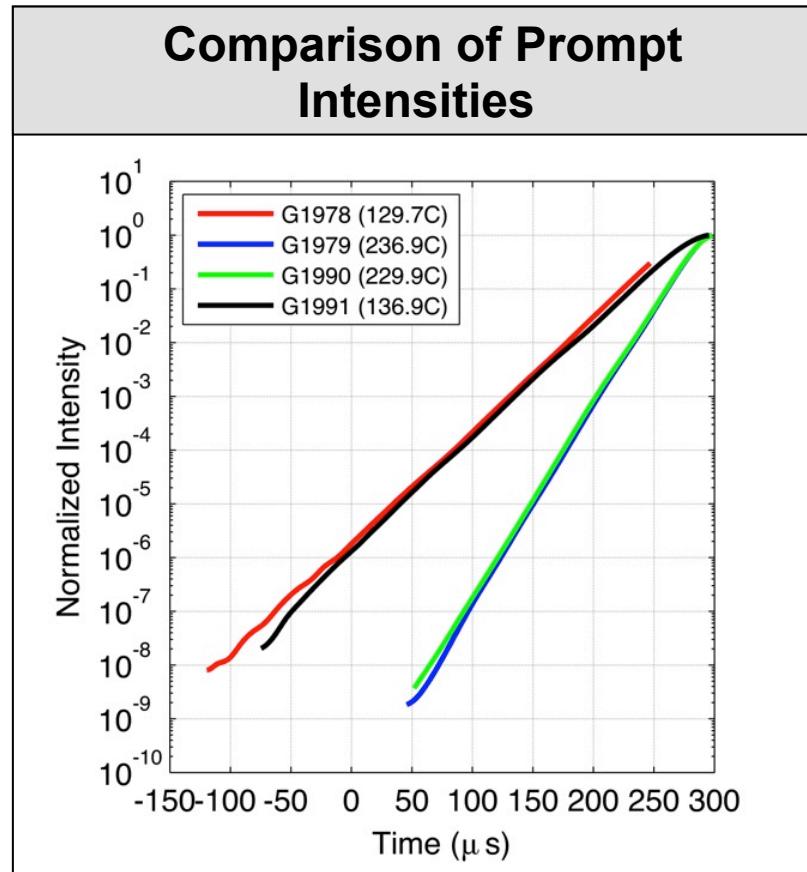

## Assembled Data for Godiva Bursts

Assembled data from 4 sensors into one record using a least squares covariance fit.

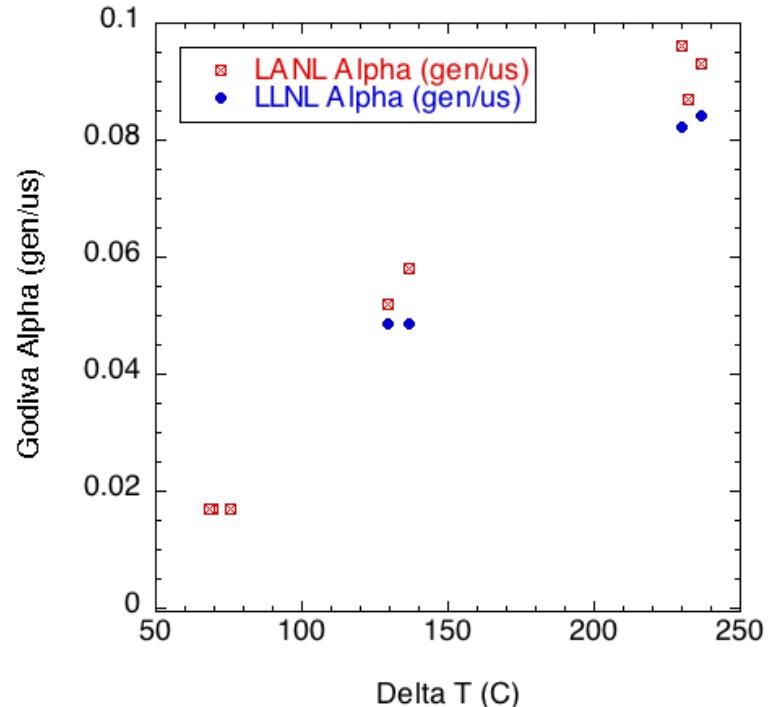

## Comparison of Godiva Intensities and Alphas

***Time resolved Godiva Intensities and alpha are repeatable***

## Comparison of Godiva Alpha Measurements

### Comparison of Prompt Alphas

Burst #	Rctvty (Cents)	Delta T (°C)	LANL $\alpha$ (gen/ $\mu$ s)	LLNL $\alpha$ (gen/ $\mu$ s)
1977	102.0	75.4	0.017	
1978	106.0	129.7	0.052	0.0487
1979	111.0	236.9	0.093	0.0843
1980	110.5	232.4	0.087	
1990	111.3	229.9	0.096	0.0821
1991	106.9	136.9	0.058	0.0485
1992	102.0	69.2	0.017	
1993	-	71.1	-	
1994	102.0	68.5	0.017	

LANL: Single PD with lower S/N

LLNL: 4 Channels with high S/N and Sophisticated Algorithm

***LANL Alpha measurements are slightly higher than LLNL measurements***

Lawrence Livermore  
National Laboratory

## Determination of Fission Yields

- Correct the recorded energy flux on the prompt detector to total flux into  $4\pi$ .
  - room scattering is ignored.
- Detector recorded energy flux has contributions from both neutrons ( $I_n$ ) and gammas ( $I_\gamma$ ).

$$E_{\text{Sensor}} = C_n(E) * I_n + C_\gamma(E) * I_\gamma$$

$C_n$  - deposited energy by neutrons\*: 0.2 MeV @ 2 MeV<sup>1</sup>

$C_\gamma$  - deposited energy by gamma rays\*: 0.65 MeV @ 2 MeV<sup>2</sup>

- The number of fissions and leakage neutrons are related to the number gammas<sup>2</sup>:

$$I_F = I_\gamma / 0.42 ; \quad I_n = 3.74 * I_\gamma$$

- Fission rate can be related to energy flux deposit in the detector.

$$I_F = I_\gamma / 0.42 = E_{\text{Sensor}} / (C_n * R + C_\gamma) / 0.42 = E_{\text{Sensor}} / 0.588$$

## Summary of Fission Yields

**Total Number of Fissions**

Godiva Burst	1979	1990	1991
Delta Temperature (C)	236.9	229.9	136.9
Distance (m)	3.15	3.15	3.15
$t(\text{FWHM}) (\mu\text{s})$	34.47	35.43	61.34
(x10 <sup>16</sup> ) Total Fissions from Prompt	5.45	5.77	2.50
(x10 <sup>16</sup> ) Total Fissions from Foils (Hickman and Heinrich)	4.05	3.18	1.62

***Prompt Godiva Yields are in Fair Agreement to Yields from Foil Measurements***

## Godiva Conclusions

---

- Total fission yields estimates from prompt measurements are in fair agreement with foil measurements.
  - Improved total fission yield estimates possible with higher fidelity modeling.
- LLNL measured Godiva alphas are slightly lower than LANL measurements
